

ABSTRACT OF THE DISCLOSURE

When an Offset or rotation sort output is designated as an output style, whether document data of one copy is printed to one paper (physical sheet) and outputted or not is discriminated. When it is printed to one paper, it is intended to enable the print such that the Offset or rotation output is not performed. An information processing apparatus has: a finishing command setting unit which can set a finishing command to a printer so as to rotation-sort-output or Offset-output the document data; and a counter for counting the number of physical sheets to which the document data of one copy whose output is desired is allocated. The finishing command setting unit sets the finishing command in a manner such that when the document data of one copy is printed onto one physical sheet as a result of the counting by the counter, the rotation sort output or the Offset output is not performed, and when the document data of one copy is printed onto two or more physical sheets, the rotation sort output or the Offset output is performed.
